Prompt file format (planned)

This document describes a **planned** .prompt file format for future export/import support. The current macOS app target does **not** implement export or import yet.

File extension

- .prompt

Payload (proposed)

JSON dictionary with keys:

- id (UUID string)
- title (String)
- content (String)
- isFavorite (Bool)
- isArchived (Bool)
- createdAt (TimeInterval, seconds since Unix epoch)
- updatedAt (TimeInterval, seconds since Unix epoch)
- tags ([String], optional tag names)
- templateVariables (optional array), each with:
 - name (String)
 - defaultValue (String)
 - sortOrder (Int)

Encryption (proposed)

- AES-GCM with a key derived from SHA-256(password).
- No salt or additional key derivation is currently planned.

Export/import behavior (proposed)

- Export is per prompt (one file per prompt).
- Import should restore title/content, favorite/archive, and tags.
- id and timestamps are optional restore fields (TBD).

Integration notes

- If you plan to evolve the format, include a version field and keep old keys stable for backward compatibility.
