Compliance and security audit checklist

This checklist captures the current behavior of the macOS app target and points auditors to evidence in the codebase.

Data residency

- Data is stored locally in the app sandbox using `SwiftData`.
- Evidence: `Pault/PaultApp.swift`, `Pault/Prompt.swift`, `Pault/Tag.swift`, `Pault/TemplateVariable.swift`.

Network egress

- No network frameworks or HTTP clients are referenced in the app target.
- Evidence: repository search shows no `URLSession`, `URLRequest`, or network client usage.

Encryption at rest

- The app does not implement application-layer encryption.
- Relies on macOS encryption (`FileVault`) and disk policies.
- Evidence: no crypto libraries or encryption routines in the app target.

Data in transit

- No network transfer of prompt data in the current build.
- Clipboard usage exposes prompt content to the pasteboard.
- Evidence: `Pault/ContentView.swift`, `Pault/MenuBarContentView.swift`, `Pault/HotkeyLauncherView.swift`.

Permissions

- Hotkey uses Carbon event manager (no prompt expected).
- Paste simulation uses `CGEvent` and requires Accessibility permission.
- Evidence: `Pault/GlobalHotkeyManager.swift`, `Pault/HotkeyLauncherView.swift`.

Retention and deletion

- No retention policy is implemented.
- Deletion removes the prompt from the local store.
- Evidence: `Pault/ContentView.swift`, `Pault/MenuBarContentView.swift`.

Logging

- Errors are logged through Apple unified logging (`os.Logger`); no remote logging.
- Evidence: `Pault/PaultApp.swift`, `Pault/GlobalHotkeyManager.swift`, `Pault/PromptService.swift`.

Backup and restore

- No built-in export/import.
- Backups rely on OS or enterprise tooling.
- Evidence: docs/DATA_STORE.md.
